I. INTRODUCTION

Let the state of the controlled object is described by the function \( u(t, x) \), which satisfies the equation

\[
u_i = a^2 u_{xix} + \sum_{k=1}^{m} b_k(x)u(t, x_k) + p(t, x)
\]

in the oblast \( Q = \{0 \leq x \leq 1, \quad 0 \leq t \leq T\} \) and satisfies the initial and boundary conditions

\[
u(0, x) = u^0(x), \quad u_i(t, 0) = 0, \quad u_i(t, 1) + \alpha u_s(t, 1) = 0, \quad \alpha = \text{const} > 0
\]

on the border of this oblast. Here \( 0 < x_1 < x_2 < ... < x_m < 1 \) are the known phase points, \( b_k(x) \) and \( u^0(x) \) are the given functions in \( L_2(0,1) \), but \( p(t, x) \) is a control parameter.

We will assume that all the functions in \( L_2(Q) \) are the admissible controls.

The problem of control with minimal energy consists of determining of such control from the class of admissible controls that, the corresponding solution to the problem satisfies the condition

\[ u(T, x) = \psi(x) \]

and the functional

\[ I[p] = \|p\|^2_{L_2(Q)} \]

takes on it’s minimal admissible value, where \( \psi(x) \in L_2(0,1) \) is a given function.
\[ R(t, \tau) = \{ R_n(t, \tau) \}_{i=1}^{1,m} , \]
\[ \bar{u}(t) = \{ u_i(t) \}_{i=1}^{1,m} , \quad \phi(t) = \{ \phi_i(t) \}_{i=1}^{1,m} , \]
then we can write the system (8) in the vector form:
\[ u(t) = \int_0^T R(t, \tau) \bar{u}(\tau)d\tau + \phi(t) \]
and which solution we can organize in the following form:
\[ \bar{u}(t) = \sum_{n=0}^{\infty} v_n(t) ; \quad v_c(t) = \phi(t) , \]
\[ v_n(t) = \int_0^T R(t, \tau)v_{n-1}(\tau)d\tau , \quad n = 1,2,... \]

Consequently, the solution to the problem (1)-(3) is determined by the formula (7).

III. STATEMENT OF THE PROBLEM IN INFINITE-DIMENSIONAL PHASE SPACE

To solve the problem with minimal energy let’s formulate it in infinite dimensional phase space. So we’ll find the solution to the problem (1)-(3) in the following form:
\[ u(t, x) = \sum_{n=0}^{\infty} u_n(t) X_n(x) , \]
\[ u_n(t) = \int_0^T u(t, x) X_n(x) dx . \]

Then to determine the coefficients \( u_n(t) \) we’ll obtain the infinite system of ordinary differential equations
\[ u_n(t) = -a^2 \lambda_n^2 u_n(t) + \sum_{n=1}^{\infty} b_n u_n(t) + p_n(t) \quad (9) \]
with initial conditions
\[ u_n(0) = u_n^0 \quad (10) \]
here \( \sum_{i=1}^{\infty} b_i X_i(x) = u_n^0, b_n, P_n(t) \) are the coefficients of Fourier functions \( u_n^0(x), b_n(x), p(t, x) \).

The final condition (4) takes on the following form:
\[ u_n(T) = \psi_n \quad (11) \]
where \( \psi_n \) are the coefficients of the Fourier functions \( \psi(x) \).

In addition to the functions \( X_n(x), n = 1,2,... \) are generate the complete system of orthonormal functions, the functional takes on the form:
\[ J[p] = \int_0^T \sum_{n=1}^{\infty} p_n^2(t) dt \quad (12) \]
The class of admissible controls is the class of infinite dimensional vector functions
\[ p(t) = (p_1(t), p_2(t), ...) , \]
which satisfy the following condition
\[ \int_0^T p_n^2(t) dt < \infty . \]

So, it is required to find such admissible control that, corresponding to this control the solution to the problem (9)-(10) satisfies the final condition (11) and in addition to this the functional (12) gets minimal value.

IV. THE SOLUTION TO THE PROBLEM ON CONTROL WITH MINIMAL ENERGY

If we’ll denote
\[ y(t) = (u_1(t), u_2(t), ...), \quad p(t) = (p_1(t), p_2(t), ...) , \]
\[ y^0 = (u_1^0, u_2^0, ...), \quad y^1 = (\psi_1, \psi_2, ...), \]
\[ A = \begin{pmatrix} b_2 & b_1 & \ldots \\ b_2 & -a^2 \lambda_1^2 + b_1 & \ldots \\ \ldots & \ldots & \ldots \end{pmatrix} \]
then we can write the problem (9)-(10) in the vector form:
\[ \dot{y}(t) = Ay(t) + P(t) , \quad y(0) = y^0 \]
(13)
(14)

But the final condition takes on form
\[ y(T) = y^1 . \quad (15) \]

We can represent the solution to the problem (13)-(14) by Cauchy formula in the following form:
\[ \dot{y}(t) = e^{\alpha t} y^0 + \int_0^t e^{\alpha(t-\tau)} p(\tau)d\tau . \]

We’ll obtain that the control function which satisfies the torque condition
\[ \int_0^T e^{\alpha(T-\tau)} p(t) dt = c \quad (16) , \]
if we consider condition (13), where \( c = y^1 - e^{\alpha T} y^0 \).

We can write the expression (16) in the following form
\[ (h_i, p) = c_i , \quad i = 1,2,... \quad (17) \]
if we’ll denote \( i \)-th row of the matrix \( e^{\alpha(T-\tau)} \) by \( h_i(t) \).

Consequently, it is required to find such control among the admissible controls that, this control will be satisfied the condition (17) and in addition to this its norm will be minimal.

The control \( p(t) \) satisfying this condition we’ll find in the following form:
\[ p(t) = \sum_{i=1}^{\infty} \alpha_i h_i(t) . \quad (18) \]
As well as this function satisfies conditions (17), then the vector \( \alpha = (\alpha_1, \alpha_2, \ldots) \) is the solution to the infinite system of equations

\[
M\alpha = c
\]

(19)

where the elements of the matrix \( M \) is determined in the following form:

\[
M = \begin{pmatrix} h_i, h_j \end{pmatrix}, \ i, j = 1.
\]
